The establishment of an effective pain management system in the perioperative period is critical to achieving the goals of enhanced surgical patient outcomes. A comprehensive understanding of the principles of postoperative pain management in infants and children is essential to ensure the delivery of safe and effective analgesia. Despite this, there are currently no published guidelines or consensus statements for the use of analgesia in infants and children. This review explores the available published guidelines and consensus statements and attempts to synthesise the available evidence. The majority of guidelines and consensus statements address the issues of the use of regional anaesthesia and opioids; the experience of the healthcare professional involved in the care of the infant or child; and the definition and assessment of pain in infants and children. However, it is recognised that there are currently few high-quality randomised controlled trials in this area and only limited evidence to guide the use of analgesia in this population. This lack of evidence may be due to the smaller numbers of patients in this age group undergoing surgical procedures. Future research in this area needs to focus on the development of clear clinical trial protocols, the establishment of appropriate trial endpoints and the collection of data on the efficacy and safety of analgesia in infants and children.Q: Who is Jonas Salk? ca3bfb1094
